

Why Should I Upgrade?

Allegro QX Software 6.1

Indispensable to Allegro QX users who work with large survey or route files, this latest software version provides technicians with easy access to the files they use and the records within them.

Faster file navigation

- Once you upgrade, you'll be able to easily access a list of recently used files. This latest software also remembers the last record you were on so, after you open a file, you can go directly to the right facility instead of searching through dozens of records to find it.

Better facility sorting

- Version 6.1 includes sorting themes that let you group facilities by odd or even address on the fly so you can avoid crossing the street or skipping every other facility in your survey file. It also saves the last sort you selected before exiting so you can easily access it once you resume work.

Easy text filtering

- This latest software makes it faster and easier to find the exact facility you need to inspect within your survey file since it lets you pre-define your prompt theme to filter facilities based on specific text strings.
